

# About Null Check

The case of lazy initialization

S.Ducasse, L. Fabresse, G. Polito, and P. Tesone

# Goals

- Think about object initialization
- Present **Lazy Initialization**
- Complement to 'Avoid Nil' Lectures

# Problem

- Need to reduce startup time
- How can we do less at the beginning?
- Sometimes you do not want to be **forced** to initialize all the state at **instance creation time**

# Solution

- **Only** perform initialization **if** the state is used
- Delay initialization until needed

# Lazy initialization

- Let `nil` value in instance variable
- Do not initialize instance variable at **instantiation time**
- Do not expose instance variable `nil`
  - Do not access instance variable **directly**
- Only access instance variable via a **lazy accessor**

# Lazy accessor

```
MyObject >> x  
^ x ifNil: [ x := 0]
```

# Example of Lazy Initialization

You defer the initialization of the variable to its first use

```
FreeTypeFont >> descent  
  ^ cachedDescent ifNil: [  
    cachedDescent := (self face descender * self pixelSize //  
      self face unitsPerEm) negated ]
```

- This is only when the method `descent` is executed that `cachedDescent` will be initialized

# Solution: Use Lazy Initialization when Necessary

- **Defer** initialization and caches the result
- Pay attention you should NOT access directly an instance variable used in a lazy setting
- You should **always use the lazy accessor**
- Else you expose to `nil` value and will force client to check

# Pros/Cons

- Lazy initialization trade execution at instance creation time for a check at each execution (ifNil:)

# Conclusion

- Lazy initialization is another tool at hand
- Don't overuse it
