A double dispatch starter

Stone Paper Scissors

S. Ducasse, L. Fabresse, G. Polito, and P. Tesone
Goals

- Exercise dispatch
- Do not use conditionals!
- Implement:

```
> Stone new vs: Paper new
#paper
```

Goals

Stone Paper Scissors: one Test

```
StonePaperScissorsTest >> testPaperIsWinning
    self assert: (Stone new vs: Paper new) equals: #paper
```

The inverse too

StonePaperScissorsTest >> testPaperIsWinning
    self assert: (Stone new vs: Paper new) equals: #paper

StonePaperScissorsTest >> testPaperIsWinning
    self assert: (Paper new vs: Stone new) equals: #paper

Let us start

```
StonePaperScissorsTest >> testPaperIsWinning
    self assert: (Stone new vs: Paper new) equals: #paper
```

```
Stone >> vs: anElement
    ^ ...
```

Hint 1

- The solution does not contain an explicit condition (no if, no checks)
- Remember sending a message is making a choice: it selects the right method

Hint 2: 3 classes

- Stone
- Paper
- Scissors

More hints

- When we execute the method vs: we know the receiver of the message
- So we have already half of the solution
- Introduce another method playAgainstStone to make **another** choice

Defining Paper » playAgainstStone

```
Stone >> vs: anElement
    ^ ... playAgainstStone
```

```
Paper >> playAgainstStone
    ^ ...
```

Defining Paper » playAgainstStone

```
Stone >> vs: anElement
    ^ anElement playAgainstStone
```

```
Paper >> playAgainstStone
    ^ ...
```

Paper playAgainstStone definition

```
Stone >> vs: anElement
    ^ anElement playAgainstStone
```

```
Paper >> playAgainstStone
    ^ #paper
```

Stone new vs: Scissor new

Works for

```
> Stone new vs: Paper new
#paper
```

But not for

```
> Stone new vs: Scissor new
...
```

- How to fix this?
- Easy!

Supporting aScissor as argument

```
Stone >> vs: aScissor
    ^ aScissor playAgainstStone
```

- So we should implement playAgainstStone on Scissor

```
Scissors >> playAgainstStone
    ^ ...
```

Other playAgainstStone definitions

```
Scissors >> playAgainstStone
    ^ #stone
```

```
Stone >> playAgainstStone
    ^ #draw
```

Full code of Stone

```
Stone >> vs: anElement
    ^ anElement playAgainstStone
```

```
Paper >> playAgainstStone
    ^ #paper
```

```
Scissors >> playAgainstStone
    ^ #stone
```

```
Stone >> playAgainstStone
    ^ #draw
```

Stepping back

- While executing the method Stone»vs:, we **know** that the method is executed on Stone class
- We **send another message to the argument** to select another method (here playAgainstStone)
- Conclusion: **Two** messages to be able to select a method based on its receiver AND argument

Full code of Scissors

```
Scissors >> vs: anElement
    ^ anElement playAgainstScissors
```

```
Scissors >> playAgainstScissors
    ^ #draw
```

```
Paper >> playAgainstScissors
    ^ #scissors
```

```
Stone >> playAgainstScissors
    ^ #stone
```

Full code of Paper

```
Paper >> vs: anElement
    ^ anElement playAgainstPaper
```
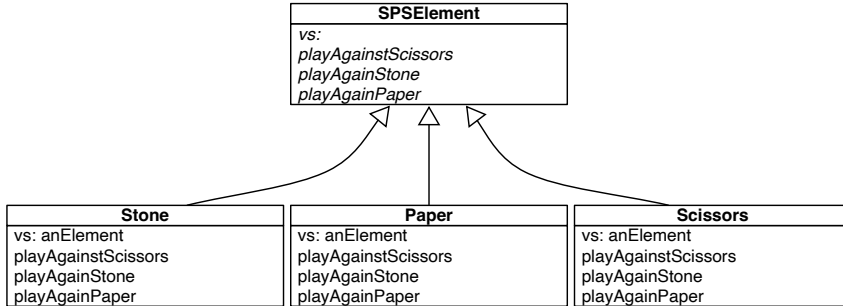

```
Scissors >> playAgainstPaper
    ^ #scissors
```

```
Paper >> playAgainstPaper
    ^ #draw
```

```
Stone >> playAgainstPaper
    ^ #paper
```

Solution overview

Double dispatch

- Two messages: vs: and one of playAgainstPaper, playAgainstStone or, playAgainstScissors
- First the system selects the correct vs:
- Second it selects the second method

Remark

- In this toy example we do not need to pass the argument during the double dispatch
- But in general this is important as we want to do something with the first receiver (as in Visitor Design Pattern)
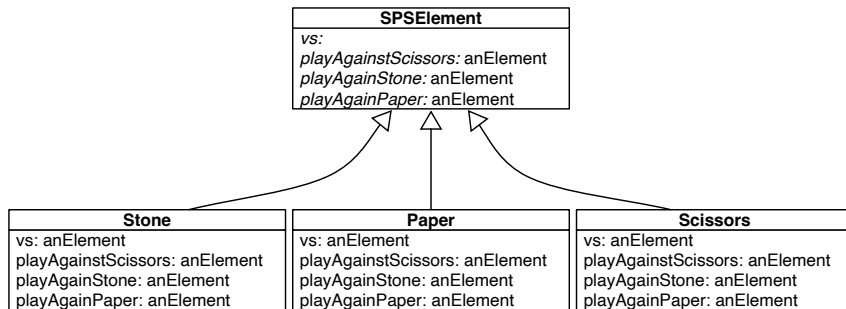

```
Scissors >> playAgainstPaper
    ^ #scissors
```

will just be

```
Scissors >> playAgainstPaper: aScissors
    ^ #scissors
```
With an argument

SPSElement

vs:
playAgainstScissors: anElement
playAgainStone: anElement
playAgainPaper: anElement

Stone	**Paper**	**Scissors**
vs: anElement	vs: anElement	vs: anElement
playAgainstScissors: anElement	playAgainstScissors: anElement	playAgainstScissors: anElement
playAgainStone: anElement	playAgainStone: anElement	playAgainStone: anElement
playAgainPaper: anElement	playAgainPaper: anElement	playAgainPaper: anElement

Paper >> vs: anotherTool
^ anotherTool playAgainstPaper: self

Extensible

- You can extend Stone, Paper, Scissors with Spock and Lizard **without changing any line** of existing code.
- Implement it!

Conclusion

- Powerful
- Modular
- Just sending an extra message to an argument and using late binding
